

ABSTRACT:

In the case of a process for monitoring the operability of a weight-sensing system in a vehicle with at least one force sensor (2, 4, 6, 8), the weight-sensing system emits a warning message when a threshold value for the force acting upon the force sensor (2, 4, 6, 8) is exceeded, which warning message points to a possible damage to the weight-sensing system. This measure ensures a reliable detection of a possible failure of the weight-sensing system.
